

SaMS TBMP 3rd Meeting: Notes from Other Workgroups & the SAC

Education & Outreach Workgroup (January 24, 2019):

- Other workgroups may benefit from being involved in the pilot outreach campaign or running a concurrent pilot project.
- Recommend coordinating on possible funding opportunities identified by other workgroups and identifying, collectively, possible funding needs prior to reaching out to those identified.

Non-Traditional BMPs Workgroup (March 5, 2019):

- Recommends the Traditional BMP workgroup include recommended methods for appropriate “temporary” salt pile storage by private applicators (such as in a commercial or property management situation).
- Recommends the Traditional BMP workgroup include recommended application rates for private applicators that could be distributed in fact sheets by locality staff.

Stakeholder Advisory Committee (May 29, 2019):

- There is interest in including cost savings and material reduction estimates in the BMP Pros and Cons.
 - Consider updating cost savings and material reduction estimates in the future using the tracking recommendations from the Salt Tracking & Reporting workgroup
 - Consider and reference the source of the cost savings and material reduction estimates in the BMP Pros and Cons document.
- Follow-up feedback from after the meeting:
 - I think it would be very helpful if both BMPs provided a matrix of the products that includes the recommended application rate relative to conditions such as temperature and ground temperature. And it would be helpful to know what results to reasonable expect, i.e., how long the product takes to work and how long it will remain effective.
